

Hybrid Data Center

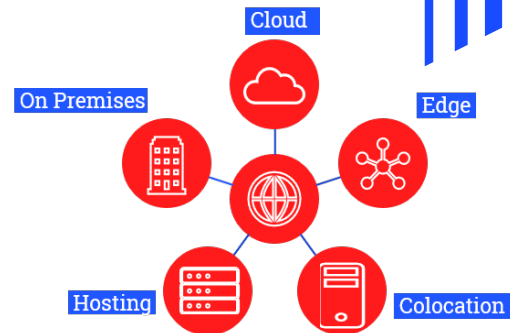

The data center of the future is a hybrid model designed with flexibility to meet the demands of your business.

The traditional data center has been the center point for supporting the demands of the business. The modern data center is no longer tied to a physical location. Instead, it is integrated into the very fabric of an organization. Data centers are now part of a wider hybrid strategy in which business applications, workloads, and data reside in several locations.

Best of Both Worlds

There are many options for how a data center can be organized and operated: public and private cloud, colocation facilities, and various levels of service for managing and monitoring different environments. Adding to the mix, many companies are choosing to take advantage of consumption-based infrastructure. Key technology OEMs are now offering packaged compute, storage, and software through this model. This provides the best of both worlds with on-premises infrastructure that allows for pay-per-use consumption. The value of consuming technology this way is it eliminates over provisioning – freeing up money, and typically is available when you need it, eliminating supply chain issues. It can also be purchased as an OPEX or CAPEX expense, allowing you to align with business needs.

Whatever vision you may have of your future data center, the most important consideration is choosing partners that can help you tie it all together and deliver a seamless customer experience.

Benefits

- Distributed, simplified, standardized, and rationalized
- Intelligent, software defined, and automated
- Always available / services defined
- Smaller, denser, and vertical
- Efficient and cost effective
- Agile and flexible
- Multiconnected
- Greener and sustainable
- Regulated

Solutions

- Data center infrastructure
- Hyper-converged systems
- Hybrid cloud
- Next-generation data protection
- Infrastructure consumption
- Virtual desktop infrastructure
- Virtualization

Supporting Services

- Consulting
- Assessments
- Design & deploy
- Workload migration
- DevOps & automation
- Professional services
- Managed services
- Service desk

How Can Logicalis Help

Logicalis will provide the answers and recommend the best possible solutions for your business by focusing on:

- Understanding your application workloads and associated data
- Providing expert advice and guidance on the best platforms and services to use
- Simplifying operations through service automation
- Implementing standardization and simplified management
- Streamlining the provisioning of services
- Properly managing workloads and data through standardized IT operations

What we can do for your organization?

Contact Logicalis to learn how we can help.
